| <b>1 Description</b>   | <b>4</b> |
| 1.1 Contents   | 4        |
| 1.2 Parameter handling in xtpplib-common                               | 4        |
| <b>2 XSLT Modules</b>  | <b>6</b> |
| 2.1 XSLT (2.0): compare.mod.xsl  | 6        |
| 2.1.1 Named template: xtlc:compare-documents as element(xtlc:message)* | 6        |
| 2.2 XSLT (2.0): date-time.mod.xsl                                      | 6        |
| 2.2.1 Function: xtlc:day-in-year-number() as xs:integer                | 7        |
| 2.2.2 Function: xtlc:days-in-month() as xs:integer                     | 7        |
| 2.2.3 Function: xtlc:format-date-as-text() as xs:string                | 8        |
| 2.2.4 Function: xtlc:format-date-as-text-short() as xs:string          | 8        |
| 2.2.5 Function: xtlc:is-leap-year() as xs:boolean                      | 8        |
| 2.2.6 Function: xtlc:month-name() as xs:string                         | 8        |
| 2.2.7 Function: xtlc:month-name-short() as xs:string                   | 8        |
| 2.2.8 Function: xtlc:to-date() as xs:date                              | 8        |
| 2.2.9 Function: xtlc:unix-epoch() as xs:decimal                        | 8        |
| 2.2.10 Function: xtlc:week-number() as xs:integer                      | 9        |
| 2.2.11 Function: xtlc:weekday-name() as xs:string                      | 9        |
| 2.2.12 Function: xtlc:weekday-number() as xs:integer                   | 9        |
| 2.3 XSLT (2.0): format-output.mod.xsl                                  | 9        |
| 2.3.1 Function: xtlc:duration2str() as xs:string                       | 9        |
| 2.3.2 Function: xtlc:format-amount() as xs:string                      | 9        |
| 2.3.3 Function: xtlc:format-double() as xs:string                      | 9        |
| 2.3.4 Function: xtlc:size2str() as xs:string                           | 10       |
| 2.4 XSLT (2.0): general.mod.xsl  | 10       |
| 2.4.1 Named template: xtlc:raise-error                                 | 11       |
| 2.4.2 Function: xtlc:att2str() as xs:string                            | 11       |
| 2.4.3 Function: xtlc:capitalize() as xs:string                         | 11       |
| 2.4.4 Function: xtlc:char-repeat() as xs:string                        | 11       |
| 2.4.5 Function: xtlc:count-leading-whitespace() as xs:integer          | 11       |
| 2.4.6 Function: xtlc:elm2str() as xs:string                            | 11       |
| 2.4.7 Function: xtlc:item2element() as element()?                      | 12       |
| 2.4.8 Function: xtlc:items2str() as xs:string                          | 12       |
| 2.4.9 Function: xtlc:prefix-to-length() as xs:string                   | 12       |
| 2.4.10 Function: xtlc:q() as xs:string                                 | 12       |
| 2.4.11 Function: xtlc:str2bln() as xs:boolean                          | 12       |
| 2.4.12 Function: xtlc:str2id() as xs:string                            | 12       |
| 2.4.13 Function: xtlc:str2id() as xs:string                            | 13       |
| 2.4.14 Function: xtlc:str2int() as xs:integer                          | 13       |
| 2.4.15 Function: xtlc:str2regexp() as xs:string                        | 13       |
| 2.4.16 Function: xtlc:str2regexp() as xs:string                        | 13       |
| 2.4.17 Function: xtlc:str2seq() as xs:string*                          | 13       |
| 2.4.18 Function: xtlc:text2lines() as xs:string*                       | 13       |
| 2.5 XSLT (2.0): href.mod.xsl   | 14       |
| 2.5.1 Function: xtlc:href-add-encoding() as xs:string                  | 14       |
| 2.5.2 Function: xtlc:href-canonical() as xs:string                     | 14       |
| 2.5.3 Function: xtlc:href-concat() as xs:string                        | 15       |
| 2.5.4 Function: xtlc:href-decode-uri() as xs:string                    | 15       |
| 2.5.5 Function: xtlc:href-ext() as xs:string                           | 15       |
| 2.5.6 Function: xtlc:href-is-absolute() as xs:boolean                  | 15       |
| 2.5.7 Function: xtlc:href-name() as xs:string                          | 15       |
| 2.5.8 Function: xtlc:href-name-noext() as xs:string                    | 15       |
| 2.5.9 Function: xtlc:href-noext() as xs:string                         | 16       |
| 2.5.10 Function: xtlc:href-path() as xs:string                         | 16       |
| 2.5.11 Function: xtlc:href-protocol() as xs:string                     | 16       |

|          |   |           |
|----------|---|-----------|
| 2.5.12   | Function: xtlc:href-protocol() as xs:string .....                   | 16        |
| 2.5.13   | Function: xtlc:href-protocol-add() as xs:string .....               | 16        |
| 2.5.14   | Function: xtlc:href-protocol-present() as xs:boolean .....          | 17        |
| 2.5.15   | Function: xtlc:href-protocol-remove() as xs:string .....            | 17        |
| 2.5.16   | Function: xtlc:href-relative() as xs:string .....                   | 17        |
| 2.5.17   | Function: xtlc:href-relative-from-path() as xs:string .....         | 17        |
| 2.5.18   | Function: xtlc:href-result-doc() as xs:string .....                 | 17        |
| 2.6      | XSLT (2.0): message.mod.xsl .....                                   | 17        |
| 2.6.1    | Named template: xtlc:msg-create as element(xtlc:message) .....      | 18        |
| 2.7      | XSLT (2.0): mimetypes.mod.xsl .....                                 | 18        |
| 2.7.1    | Function: xtlc:ext2mimetype() as xs:string .....                    | 18        |
| 2.7.2    | Function: xtlc:mimetype2ext() as xs:string .....                    | 18        |
| 2.8      | XSLT (3.0): parameters.mod.xsl .....                                | 18        |
| 2.8.1    | Function: xtlc:expand-text-against-parameters() as xs:string .....  | 19        |
| 2.8.2    | Function: xtlc:parameters-get() as map(xs:string, xs:string*) ..... | 19        |
| 2.9      | XSLT (2.0): uuid.mod.xsl .....                                      | 19        |
| 2.9.1    | Function: xtlc:get-uuid() as xs:string .....                        | 19        |
| 2.9.2    | Function: xtlc:is-real-uuid() as xs:boolean .....                   | 20        |
| <b>3</b> | <b>XProc 1.0 Libraries .....</b>                                    | <b>21</b> |
| 3.1      | XProc (1.0) library: common.mod.xpl .....                           | 21        |
| 3.1.1    | Step: xtlc:copy-directory .....                                     | 21        |
| 3.1.2    | Step: xtlc:copy-file .....  | 21        |
| 3.1.3    | Step: xtlc:log .....  | 21        |
| 3.1.4    | Step: xtlc:recursive-directory-list .....                           | 22        |
| 3.1.5    | Step: xtlc:remove-dir .....   | 22        |
| 3.1.6    | Step: xtlc:tee .....  | 22        |
| 3.1.7    | Step: xtlc:zip-directory .....                                      | 23        |
| <b>4</b> | <b>XProc 3.0 Support .....</b>                                      | <b>24</b> |
| 4.1      | oXygen XProc 3.0 support .....                                      | 24        |
| 4.2      | XProc (3.0) pipeline: copy-dir.xpl .....                            | 24        |
| 4.3      | XProc (3.0) pipeline: create-clear-directory.xpl .....              | 25        |
| 4.4      | XProc (3.0) pipeline: recursive-directory-list.xpl .....            | 25        |
| 4.5      | XProc (3.0) pipeline: validate.xpl .....                            | 26        |
| 4.6      | XProc (3.0) pipeline: write-log.xpl .....                           | 26        |
| 4.7      | XProc (3.0) pipeline: zip-directory.xpl .....                       | 27        |
| <b>5</b> | <b>XSLT Stylesheets .....</b>                                       | <b>28</b> |
| 5.1      | XSLT (2.0): get-system-properties.xsl .....                         | 28        |
| 5.2      | XSLT (2.0): xslmod2xqmod-stub.xsl .....                             | 28        |
| <b>6</b> | <b>XML Data Files .....</b>   | <b>29</b> |
| 6.1      | XML document: dummy.xml .....                                       | 29        |
| 6.2      | XML document: fop-default-config.xml .....                          | 29        |
| 6.3      | XML document: mimetypes-table.xml .....                             | 29        |
| <b>7</b> | <b>XML Schemas .....</b>  | <b>30</b> |
| 7.1      | XML Schema: message.xsd .....                                       | 30        |
| 7.2      | XML Schema: mimetypes.xsd .....                                     | 30        |
| 7.3      | XML Schema: parameters.xsd .....                                    | 30        |

## 0 Xatapult XML Library - Common code

**xtpplib** library - component **xtpplib-common** - v2.0.1 (2023-07-22)  
 Xatapult Content Engineering - <http://www.xatapult.com> - +31 6 53260792  
 Erik Siegel - [erik@xatapult.com](mailto:erik@xatapult.com)

**xtpplib-common** is part of the **xtpplib** library. **xtpplib** contains software for processing XML, using languages like XSLT and XProc. It consists of several separate components, all named **xtpplib-\***. Everything can be found on GitHub (<https://github.com/xatapult>).

**xtpplib-common** is **xtpplib**'s communal component. Most other **xtpplib** components rely on it. It contains:

- XSLT libraries, with functionality for handling parameters, manipulating filenames/URIs, MIME types, etc.
- Parts of the functionality of the XSLT libraries are translated into XQuery.
- XProc (1.0 and 3.0) steps, implementing things like recursive directory lists, creating ZIP files from directories, etc.
- Templates (empty XSLT, XProc, XQuery, etc. files) for use in the oXygen IDE.

Installation and usage information can be found on **xtpplib**'s main website <https://www.xtpplib.org>.

### Technical information:

Component documentation: <https://common.xtpplib.org>

License: GNU GENERAL PUBLIC LICENSE - Version 3, 29 June 2007

Git URI: `git@github.com:xatapult/xtpplib-common.git`

Git site: <https://github.com/xatapult/xtpplib-common>

### Release information:

#### **v2.0.1 - 2023-07-22 (current)**

Weekday-number and week-number calculations now also work with Saxon HE.

#### **v2.0 - 2023-07-19**

Added XProc 3.0 support.

#### **v1.3.2 - 2022-03-24**

Added indent option to `xtlc:tee`

#### **v1.3.1 - 2020-08-18**

Some bugfixes for `xtlc:log-write`

#### **v1.3 - 2020-08-18**

Added `xtlc:write-log` XProc 3.0 step

(Abbreviated. Full release information in `README.md`)

# 1 Description

xtpplib-common is xtpplib's communal component. Most other components in xtpplib are dependent on it. If you start using xtpplib, you'll also use it a lot yourself.

## 1.1 Contents

xtpplib-common consists of the following parts (by subdirectory):

| Directory | Contents   |
|-----------|--|
| data      | XML data files.  |
| doc       | Sources for the generation of the component's documentation. Internal use only.  |
| docs      | GitHub pages site for this component.  |
| etc       | Auxiliary files, mainly for use in the oXygen IDE.   |
| template  | Template files. These files contain XSLT, XQuery, XProc, etc. files with the main structure and headers filled in. Contain macros for use in the oXygen IDE.<br>To install/use these files in oXygen, open its preferences dialogue (Options > Preferences...) and add the xtpplib-common/template subdirectory to its Document templates section. |
| xpl       | General purpose XProc (1.0) pipelines. .   |
| xplmod    | General purpose XProc (1.0) modules.   |
| xpl3      | General purpose XProc (3.0) pipelines. .   |
| xpl3mod   | General purpose XProc (3.0) modules.   |
| xqmod     | General purpose XQuery modules. This is a partial translation of the XSLT module's functionality (especially from <a href="#">href.mod.xsl</a> ) into XQuery.  |
| xsd       | Schemas for some of the document types used in Xatapult XML Library.   |
| xsl       | Some general purpose XSLT stylesheets.   |
| xslmod    | General purpose XSLT modules.  |

## 1.2 Parameter handling in xtpplib-common

Parameters, as referred to here, are name/value pairs meant for customizing software's behavior. Things like prompts, URIs, etc. The xtpplib-common component's parameters have the following characteristics:

- Parameters in this component are handled by the XSLT module [parameteres.mod.xsl](#). This includes:
  - Reading them from an XML document, either a document on its own or embedded into a bigger XML document. The result will be an XPath map (`xs:string, xs:string*`), which can be inspected and used.
  - Expanding parameter references in strings. Parameter references are constructions like `{parameter-name}` (or `${parameter-name}`, both will yield the same results).
- Parameters are specified within an XML element called `<parameters>`, the namespace does not matter. This element can be the root of a document on its own or embedded in a bigger (XML) document. For instance:

```
<parameters>
  <parameter name="greeting">
    <value>Hello!</value>
  </parameter>
</parameters>
```

There is a [schema](#) available for this.

- A single parameter is specified using a `<parameter name="...">` child element. The value of the name attribute will be normalized (whitespace collapsed to a single space character, leading/trailing whitespace removed) and space characters are replaced with an underscore (`_`). So `name=" a b "` will become `parameter a_b`.
- Values for a parameter are specified using `<value>` child element. A parameter can have multiple values. Parameter references inside values (either written as `{parameter-name}` or `${parameter-name}`) are expanded into their values (for multi-valued parameters only the first value is used).

- It is often useful to specify values for parameters based on different circumstances. For instance based on language (Hello in English or Bonjour in French), or system type (<https://www...> for production, <http://test...> for test). This is implemented as follows:
  - When initially reading the parameters you can specify a filter map (`map(xs:string, xs:string*)`).
  - The `<value>` elements can have any attributes. These attributes are handled as whitespace separated lists of values.
  - The name of such an attribute is held against the entries in filter map. If a filter entry with this name exists, one of the values of the attribute must be present in the filter map.

For instance, assume the parameters look like this:

```
<parameters>
  <parameter name="greeting">
    <value lang="en">Hello!</value>
    <value lang="nl de">Hallo!</value>
    <value lang="fr">Bonjour!</value>
  </parameter>
  <parameter name="number">
    <value>123</value>
  </parameter>
</parameters>
```

- Reading this with an empty (or absent) filter map, or a filter map that does not have a `lang` entry, will result in a `greeting` parameter with multiple values, `Hello!`, `Hallo!` and `Bonjour!`.
- Reading this with a filter map `map{ 'lang': 'en' }` will return the `greeting` parameter with value `Hello!`.
- Reading this with a filter map `map{ 'lang': 'fr' }` will return the `greeting` parameter with value `Bonjour!`.
- Reading this with a filter map `map{ 'lang': ('en', 'de') }` (not particularly useful) will return the `greeting` parameter with values `Hello!` *and* `Hallo!`.
- In all cases the `number` parameter will get value `123` (since it has no filtering attributes on its `<value>` element).

It is possible to combine multiple filter attributes on a `<value>` element.

- Another thing that is often useful in specifying parameters is to *group* them. For this you can put a number of `<parameter>` elements inside a `<group name="...">` element. The name of the group is used as a prefix (with a dot (.) separator) for the parameters in the group. For instance:

```
<parameters>
  <group name="important">
    <parameter name="greeting">
      <value>Hello!</value>
    </parameter>
  </group>
</parameters>
```

This will result in a parameter called `important.greeting`.

## 2 XSLT Modules

The xtpplib-common component contains the following XSLT modules. The ones used most frequently are [general.mod.xsl](#) and [href.mod.xsl](#).

| Module/Pipeline                       | Description  |
|---------------------------------------|--|
| <a href="#">compare.mod.xsl</a>       | XSL library module with support for comparing XML documents/elements:                    |
| <a href="#">date-time.mod.xsl</a>     | XSLT library module containing functions for working with dates and times.               |
| <a href="#">format-output.mod.xsl</a> | XSLT library with functions for formatting output/strings.                               |
| <a href="#">general.mod.xsl</a>       | XSLT library module with general constants and code.                                     |
| <a href="#">href.mod.xsl</a>          | XSLT library module with functions for the generic handling of href-s (filenames/paths). |
| <a href="#">message.mod.xsl</a>       | Message related templates.   |
| <a href="#">mimetypes.mod.xsl</a>     | MIME type conversion related functions.  |
| <a href="#">parameters.mod.xsl</a>    | Takes an XML document with parameters and turns this into a parameter map.               |
| <a href="#">uuid.mod.xsl</a>          | UUID related functions.  |

Table 2-1 - Module overview

### 2.1 XSLT (2.0): compare.mod.xsl

File: xslmod/compare.mod.xsl

XSL library module with support for comparing XML documents/elements:

| Prefix | Namespace URI                   |
|--------|---------------------------------|
| xtlc   | http://www.xtpplib.nl/ns/common |

  

| Named template                         | Description                                 |
|--|---|
| <a href="#">xtlc:compare-documents</a> | Compares two XML documents with each other: |

#### 2.1.1 Named template: xtlc:compare-documents as element(xtlc:message)\*

Compares two XML documents with each other:

- Comments and processing instructions are ignored
- Text nodes are normalized before comparison
- Empty text nodes (after normalization) are ignored
- The comparison stops after the first difference is encountered.
- The result is either:
  - An empty set, when no differences found
  - One or more xtlc:message elements, status="error" when differences were found (you can only get more than one message on attribute differences)

| Parameter | Type             | Rq? | Default | Description                 |
|-----------|------------------|-----|---------|-----------------------------|
| doc1      | document-node () | yes |         | First document to compare.  |
| doc2      | document-node () | yes |         | Second document to compare. |

### 2.2 XSLT (2.0): date-time.mod.xsl

File: xslmod/date-time.mod.xsl

XSLT library module containing functions for working with dates and times.

When language based, it only distinguishes between Dutch and non-Dutch (which now means: English).

| Prefix | Namespace URI                   |
|--------|---------------------------------|
| xtlc   | http://www.xtpplib.nl/ns/common |

| Variable            | Type       | Value  | Description                                      |
|---------------------|------------|--|--|
| xtlc:day-names-en   | xs:string+ | ('Monday', 'Tuesday', 'Wednesday', 'Thursday', 'Friday', 'Saturday', 'Sunday')   | Sequence with the names of the days in English   |
| xtlc:day-names-nl   | xs:string+ | ('maandag', 'dinsdag', 'woensdag', 'donderdag', 'vrijdag', 'zaterdag', 'zondag')   | Sequence with the names of the days in Dutch     |
| xtlc:month-names-en | xs:string+ | ('January', 'February', 'March', 'April', 'May', 'June', 'July', 'August', 'September', 'October', 'November', 'December')   | Sequence with the names of the months in English |
| xtlc:month-names-nl | xs:string+ | ('januari', 'februari', 'maart', 'april', 'mei', 'juni', 'juli', 'augustus', 'september', 'oktober', 'november', 'december') | Sequence with the names of the months in Dutch   |

| Function   | Description   |
|--|---|
| <a href="#">xtlc:day-in-year-number()</a>        | Computes the day number in the year: January 1 is 1, December 31 is 365 (or 366 in leap years). |
| <a href="#">xtlc:days-in-month()</a>             | Computes the number of days in a particular month. If values are out of range it returns 0.     |
| <a href="#">xtlc:format-date-as-text()</a>       | Formats a date as a string with the month name in full.   |
| <a href="#">xtlc:format-date-as-text-short()</a> | Formats a date as a string with the month name in short.  |
| <a href="#">xtlc:is-leap-year()</a>              | Returns true when a given year is a leap year   |
| <a href="#">xtlc:month-name()</a>                | Returns the name of a month.  |
| <a href="#">xtlc:month-name-short()</a>          | Returns the name of a month in short (abbreviated to 3 characters).                             |
| <a href="#">xtlc:to-date()</a>                   | Creates a date from its components.   |
| <a href="#">xtlc:unix-epoch()</a>                | Computes the UNIX "epoch" code (number of seconds since 1-1-1970) for a given date/time.        |
| <a href="#">xtlc:week-number()</a>               | Computes the ISO week number for a given date.  |
| <a href="#">xtlc:weekday-name()</a>              | Returns the name of a month.  |
| <a href="#">xtlc:weekday-number()</a>            | The number of the weekday (1=Monday, 7=Sunday).   |

### 2.2.1 Function: [xtlc:day-in-year-number\(\)](#) as xs:integer

Computes the day number in the year: January 1 is 1, December 31 is 365 (or 366 in leap years).

| Parameter | Type    | Description  |
|-----------|---------|--------------|
| date      | xs:date | Date to use. |

### 2.2.2 Function: [xtlc:days-in-month\(\)](#) as xs:integer

Computes the number of days in a particular month. If values are out of range it returns 0.

| Parameter    | Type       | Description  |
|--------------|------------|--|
| month-number | xs:integer | The month to calculate the number of days for.               |
| year         | xs:integer | The year this month is in (important because of leap years). |

### 2.2.3 Function: xtlc:format-date-as-text() as xs:string

Formats a date as a string with the month name in full.

| Parameter | Type      | Description                      |
|-----------|-----------|----------------------------------|
| date      | xs:date   | The date to format.              |
| lang      | xs:string | The language for the conversion. |

### 2.2.4 Function: xtlc:format-date-as-text-short() as xs:string

Formats a date as a string with the month name in short.

| Parameter | Type      | Description                      |
|-----------|-----------|----------------------------------|
| date      | xs:date   | The date to format.              |
| lang      | xs:string | The language for the conversion. |

### 2.2.5 Function: xtlc:is-leap-year() as xs:boolean

Returns true when a given year is a leap year

| Parameter | Type       | Description        |
|-----------|------------|--------------------|
| year      | xs:integer | The year to check. |

### 2.2.6 Function: xtlc:month-name() as xs:string

Returns the name of a month.

| Parameter    | Type       | Description                              |
|--------------|------------|--|
| month-number | xs:integer | The month number (1-12).                 |
| lang         | xs:string  | The language you want the month name in. |

### 2.2.7 Function: xtlc:month-name-short() as xs:string

Returns the name of a month in short (abbreviated to 3 characters).

| Parameter    | Type       | Description                              |
|--------------|------------|--|
| month-number | xs:integer | The month number (1-12).                 |
| lang         | xs:string  | The language you want the month name in. |

### 2.2.8 Function: xtlc:to-date() as xs:date

Creates a date from its components.

| Parameter | Type       | Description          |
|-----------|------------|----------------------|
| day       | xs:integer | Day number to use.   |
| month     | xs:integer | Month number to use. |
| year      | xs:integer | Year to use.         |

### 2.2.9 Function: xtlc:unix-epoch() as xs:decimal

Computes the UNIX "epoch" code (number of seconds since 1-1-1970) for a given date/time.

| Parameter | Type        | Description                                  |
|-----------|-------------|--|
| datetime  | xs:dateTime | The date/time to compute the epoch code for. |

### 2.2.10 Function: `xtlc:week-number()` as `xs:integer`

Computes the ISO week number for a given date.

| Parameter | Type    | Description  |
|-----------|---------|--------------|
| date      | xs:date | Date to use. |

### 2.2.11 Function: `xtlc:weekday-name()` as `xs:string`

Returns the name of a month.

| Parameter  | Type       | Description                              |
|------------|------------|--|
| day-number | xs:integer | The day number (1-7).                    |
| lang       | xs:string  | The language you want the month name in. |

### 2.2.12 Function: `xtlc:weekday-number()` as `xs:integer`

The number of the weekday (1=Monday, 7=Sunday).

| Parameter | Type    | Description  |
|-----------|---------|--------------|
| date      | xs:date | Date to use. |

## 2.3 XSLT (2.0): `format-output.mod.xsl`

File: `xslmod/format-output.mod.xsl`

XSLT library with functions for formatting output/strings.

When language based, we only distinguish between Dutch and non-Dutch (usually English).

| Prefix | Namespace URI   |
|--------|---|
| xtlc   | <a href="http://www.xtpxlib.nl/ns/common">http://www.xtpxlib.nl/ns/common</a> |

| Function                          | Description  |
|-----------------------------------|--|
| <code>xtlc:duration2str()</code>  | Turns a day/time duration into a more readable string, e.g. 1d3h40m12s               |
| <code>xtlc:format-amount()</code> | Formats an amount by adding a € sign and always use double digits.                   |
| <code>xtlc:format-double()</code> | Formats a double as a string with a given amount of digits.                          |
| <code>xtlc:size2str()</code>      | Turns an integer (e.g. a file size) into a (rounded) number using a Kb/Mb/Gb suffix. |

### 2.3.1 Function: `xtlc:duration2str()` as `xs:string`

Turns a day/time duration into a more readable string, e.g. 1d3h40m12s

| Parameter     | Type               | Description                               |
|---------------|--------------------|---|
| duration      | xs:dayTimeDuration | The duration to convert.                  |
| round-seconds | xs:boolean         | Whether the seconds part must be rounded. |

### 2.3.2 Function: `xtlc:format-amount()` as `xs:string`

Formats an amount by adding a € sign and always use double digits.

For the Dutch language, . and , are swapped.

| Parameter | Type      | Description                      |
|-----------|-----------|----------------------------------|
| amount    | xs:double | The amount to format.            |
| lang      | xs:string | The language for the conversion. |

### 2.3.3 Function: `xtlc:format-double()` as `xs:string`

Formats a double as a string with a given amount of digits.

For the Dutch language, . and , are swapped.

| Parameter | Type       | Description  |
|-----------|------------|--|
| dbl       | xs:double  | Number to convert  |
| digits    | xs:integer | The number of digits to use. When < 0 this is left open. |
| lang      | xs:string  | The language for the conversion.                         |

### 2.3.4 Function: xtlc:size2str() as xs:string

Turns an integer (e.g. a file size) into a (rounded) number using a Kb/Mb/Gb suffix.

| Parameter | Type       | Description          |
|-----------|------------|----------------------|
| size      | xs:integer | The size to convert. |

## 2.4 XSLT (2.0): general.mod.xsl

File: xslmod/general.mod.xsl

XSLT library module with general constants and code.

| Prefix | Namespace URI                   |
|--------|---------------------------------|
| xtlc   | http://www.xtpxlib.nl/ns/common |

| Variable                   | Type       | Value   | Description  |
|----------------------------|------------|---|--|
| xtlc:default-dt-format     | xs:string  | '[Y]-[M01]-[D01][H01]:[m01]:[s01]'  | Default date/time format string (yyyy-mm-dd ...).  |
| xtlc:default-dt-format-en  | xs:string  | '[M01]-[D01]-[Y][H01]:[m01]:[s01]'  | Date/time format string (English: mm-dd-yyyy ...). |
| xtlc:default-dt-format-nl  | xs:string  | '[D01]-[M01]-[Y][H01]:[m01]:[s01]'  | Date/time format string (Dutch: dd-mm-yyyy ...).   |
| xtlc:internal-error-prompt | xs:string  | 'Internal error: '  | Add this in front of any internal error raised.    |
| xtlc:language-en           | xs:string  | 'en'  | Language code for English                          |
| xtlc:language-nl           | xs:string  | 'nl'  | Language code for Dutch                            |
| xtlc:namespace-xtlc-common | xs:string  | namespace-uri-for-prefix('xtlc', doc('')/*)   | Namespace used for xtpxlib-common.                 |
| xtlc:status-codes          | xs:string+ | (\$xtlc:status-info, \$xtlc:status-warning, \$xtlc:status-error, \$xtlc:status-debug) | Sequence with all valid status codes.              |
| xtlc:status-debug          | xs:string  | 'debug'   | Generic debug status/severity code.                |
| xtlc:status-error          | xs:string  | 'error'   | Generic error status/severity code.                |
| xtlc:status-info           | xs:string  | 'info'  | Generic info (a.k.a. OK) status/severity code.     |
| xtlc:status-warning        | xs:string  | 'warning'   | Generic warning status/severity code.              |

| Named template   | Description                               |
|------------------|---|
| xtlc:raise-error | Stops any processing by raising an error. |

| Function                        | Description  |
|---------------------------------|--|
| xtlc:att2str()                  | Turns an attribute into a string representation, suitable for display (e.g. name="value").                     |
| xtlc:capitalize()               | Capitalizes a string (makes the first character uppercase).  |
| xtlc:char-repeat()              | Returns a string with a single character repeated a given number of times.                                     |
| xtlc:count-leading-whitespace() | Counts the number of whitespace characters at the beginning of a string  |
| xtlc:elm2str()                  | Turns an element into a descriptive string (the element with all its attributes, excluding schema references). |
| xtlc:item2element()             | Tries to find the element belonging to a given item.   |
| xtlc:items2str()                | Creates a string from a sequence of items.   |

| Function                             | Description   |
|--------------------------------------|---|
| <code>xtlc:prefix-to-length()</code> | Prefixes a string with a given character so it will get at least a given length.  |
| <code>xtlc:q()</code>                | Returns the input string quoted ("\$in")  |
| <code>xtlc:str2bln()</code>          | Safe conversion of a string into a boolean.   |
| <code>xtlc:str2id()</code>           | Turns a string into a valid identifier, adding a prefix.  |
| <code>xtlc:str2id()</code>           | Turns a string into a valid identifier.   |
| <code>xtlc:str2int()</code>          | Safe conversion of a string to an integer.  |
| <code>xtlc:str2regexp()</code>       | Turns a string into a regular expression that matches the input exactly. Optionally anchors the regular expression so the match will be on this string <i>only</i> (result starts with ^ and ends with \$). |
| <code>xtlc:str2regexp()</code>       | Turns a string into a regular expression that matches the input exactly.  |
| <code>xtlc:str2seq()</code>          | Converts a string with a list of words into a sequence of words.  |
| <code>xtlc:text2lines()</code>       | Converts text into separate lines.  |

### 2.4.1 Named template: `xtlc:raise-error`

Stops any processing by raising an error.

| Parameter  | Type                   | Rq? | Default                          | Description   |
|------------|------------------------|-----|----------------------------------|---|
| error-name | <code>xs:string</code> |     | <code>\$xtlc:status-error</code> | The (optional) name of the error. Must be an NCName.  |
| msg-parts  | <code>item()+</code>   | yes |                                  | Error message to show (in parts, all parts will be concatenated by <code>xtlc:items2str()</code> ). |

### 2.4.2 Function: `xtlc:att2str()` as `xs:string`

Turns an attribute into a string representation, suitable for display (e.g. `name="value"`).

| Parameter | Type                      | Description           |
|-----------|---------------------------|-----------------------|
| att       | <code>attribute()?</code> | Attribute to convert. |

### 2.4.3 Function: `xtlc:capitalize()` as `xs:string`

Capitalizes a string (makes the first character uppercase).

| Parameter | Type                   | Description            |
|-----------|------------------------|------------------------|
| in        | <code>xs:string</code> | The string to work on. |

### 2.4.4 Function: `xtlc:char-repeat()` as `xs:string`

Returns a string with a single character repeated a given number of times.

| Parameter | Type                    | Description   |
|-----------|-------------------------|---|
| char      | <code>xs:string</code>  | The first character of this string is the character to repeat. If empty, an empty string is returned. |
| repeat    | <code>xs:integer</code> | The number of repeats. If $\leq 0$ , an empty string is returned.                                     |

### 2.4.5 Function: `xtlc:count-leading-whitespace()` as `xs:integer`

Counts the number of whitespace characters at the beginning of a string

| Parameter | Type                   | Description      |
|-----------|------------------------|------------------|
| text      | <code>xs:string</code> | Text to work on. |

### 2.4.6 Function: `xtlc:elm2str()` as `xs:string`

Turns an element into a descriptive string (the element with all its attributes, excluding schema references).

| Parameter | Type        | Description        |
|-----------|-------------|--------------------|
| elm       | element() ? | Element to convert |

### 2.4.7 Function: xtlc:item2element() as element()?

Tries to find the element belonging to a given item.

- When the item is of type `xs:string` or `xs:anyURI`, it is assumed to be a document reference. The root element of this is returned.
- When the item is of type `document-node()`, the root element of this document is returned
- When the item is of type `element()`, this is returned

You can choose whether to produce an error message or `()` when the item cannot be resolved.

| Parameter            | Type       | Description  |
|----------------------|------------|--|
| item                 | item()     | The item to work on  |
| error-on-non-resolve | xs:boolean | Whether to generate an error when <code>\$item</code> could not be resolved. Otherwise, the function will return <code>()</code> . |

### 2.4.8 Function: xtlc:items2str() as xs:string

Creates a string from a sequence of items.

Useful for easy creation of messages consisting of multiple parts and pieces.

| Parameter | Type     | Description                  |
|-----------|----------|------------------------------|
| items     | item() * | The message parts to combine |

### 2.4.9 Function: xtlc:prefix-to-length() as xs:string

Prefixes a string with a given character so it will get at least a given length.

| Parameter   | Type       | Description  |
|-------------|------------|--|
| in          | xs:string  | String to prefix   |
| prefix-char | xs:string  | String to prefix with. Only first character is used. If empty, <code>*</code> is used. |
| length      | xs:integer | The length to reach.   |

### 2.4.10 Function: xtlc:q() as xs:string

Returns the input string quoted ("`$in`")

| Parameter | Type       | Description        |
|-----------|------------|--------------------|
| in        | xs:string? | String to convert. |

### 2.4.11 Function: xtlc:str2bln() as xs:boolean

Safe conversion of a string into a boolean.

When `$in` is empty or not convertible into a boolean, `$default` is returned.

| Parameter | Type       | Description   |
|-----------|------------|---|
| in        | xs:string? | String to convert.  |
| default   | xs:boolean | Default value to return when <code>\$in</code> is empty or cannot be converted. |

### 2.4.12 Function: xtlc:str2id() as xs:string

Turns a string into a valid identifier, adding a prefix.

All characters that are not allowed in an identifier are converted into underscores.

When the result does not start with a letter or underscore, the prefix `id-` is added.

| Parameter | Type       | Description        |
|-----------|------------|--------------------|
| in        | xs:string  | String to convert. |
| prefix    | xs:string? | Prefix to apply.   |

#### 2.4.13 Function: xtlc:str2id() as xs:string

Turns a string into a valid identifier.

All characters that are not allowed in an identifier are converted into underscores.

When the result does not start with a letter or underscore, the prefix `id-` is added.

| Parameter | Type      | Description        |
|-----------|-----------|--------------------|
| in        | xs:string | String to convert. |

#### 2.4.14 Function: xtlc:str2int() as xs:integer

Safe conversion of a string to an integer.

When `$in` is empty or not convertible to an integer, `$default` is returned.

| Parameter | Type       | Description   |
|-----------|------------|---|
| in        | xs:string? | String to convert.  |
| default   | xs:integer | Default value to return when <code>\$in</code> is empty or cannot be converted. |

#### 2.4.15 Function: xtlc:str2regexp() as xs:string

Turns a string into a regular expression that matches the input exactly. Optionally anchors the regular expression so the match will be on this string *only* (result starts with `^` and ends with `$`).

| Parameter | Type       | Description   |
|-----------|------------|---|
| in        | xs:string? | String to convert   |
| anchor    | xs:boolean | If true, the resulting string will be anchored (start with <code>^</code> and ends with <code>\$</code> ) |

#### 2.4.16 Function: xtlc:str2regexp() as xs:string

Turns a string into a regular expression that matches the input exactly.

| Parameter | Type       | Description       |
|-----------|------------|-------------------|
| in        | xs:string? | String to convert |

#### 2.4.17 Function: xtlc:str2seq() as xs:string\*

Converts a string with a list of words into a sequence of words.

| Parameter | Type       | Description        |
|-----------|------------|--------------------|
| in        | xs:string? | String to convert. |

#### 2.4.18 Function: xtlc:text2lines() as xs:string\*

Converts text into separate lines.

Uses the LF as separator; CRs are removed.

| Parameter                    | Type       | Description  |
|------------------------------|------------|--|
| text                         | xs:string? | The text to convert.   |
| remove-empty-start-end-lines | xs:boolean | When <code>true</code> any empty (containing whitespace only) lines at the beginning and end are removed.  |
| normalize-indents            | xs:boolean | When <code>true</code> the indents of the lines are normalized: the indent of the non-whitespace line with the minimum leading whitespace is removed from all other lines. Lines that contain only whitespace will become zero length. |

## 2.5 XSLT (2.0): href.mod.xsl

File: xslmod/href.mod.xsl

XSLT library module with functions for the generic handling of href-s (filenames/paths).

| Prefix | Namespace URI                   |
|--------|---------------------------------|
| xtlc   | http://www.xtpxlib.nl/ns/common |

| Variable           | Type      | Value  | Description              |
|--------------------|-----------|--------|--------------------------|
| xtlc:protocol-file | xs:string | 'file' | File protocol specifier. |

| Function                                       | Description   |
|--|---|
| <a href="#">xtlc:href-add-encoding()</a>       | Percent encodes all "strange" characters (%xx). Any existing percentage encodings will be kept as is. |
| <a href="#">xtlc:href-canonical()</a>          | Makes an href canonical (remove any .. and . directory specifiers).                                   |
| <a href="#">xtlc:href-concat()</a>             | Performs a safe concatenation of href components:   |
| <a href="#">xtlc:href-decode-uri()</a>         | Reverse function of encode-fo-uri(). Translates percent encodings (%xx) into their actual characters. |
| <a href="#">xtlc:href-ext()</a>                | Returns the extension part of an href.  |
| <a href="#">xtlc:href-is-absolute()</a>        | Returns true if the href is considered absolute.  |
| <a href="#">xtlc:href-name()</a>               | Returns the (file)name part of an href.   |
| <a href="#">xtlc:href-name-noext()</a>         | Returns the (file)name part of an href without its extension.   |
| <a href="#">xtlc:href-noext()</a>              | Returns the complete href path without its extension.   |
| <a href="#">xtlc:href-path()</a>               | Returns the path part of an href.   |
| <a href="#">xtlc:href-protocol()</a>           | Returns the protocol part of an href (without the ://).   |
| <a href="#">xtlc:href-protocol()</a>           | Returns the protocol part of an href (without the ://) or a default value when none present.          |
| <a href="#">xtlc:href-protocol-add()</a>       | Adds a protocol specifier (written without the trailing ://, e.g. http) to an href.                   |
| <a href="#">xtlc:href-protocol-present()</a>   | Returns true when an href has a protocol specifier (e.g. file:// or http://).                         |
| <a href="#">xtlc:href-protocol-remove()</a>    | Removes the protocol part from an href.   |
| <a href="#">xtlc:href-relative()</a>           | Computes a relative href from one document to another.  |
| <a href="#">xtlc:href-relative-from-path()</a> | Computes a relative href from a directory path to a document.   |
| <a href="#">xtlc:href-result-doc()</a>         | Transforms an href into something xsl:result-document/@href can use.                                  |

### 2.5.1 Function: xtlc:href-add-encoding() as xs:string

Percent encodes all "strange" characters (%xx). Any existing percentage encodings will be kept as is.

| Parameter | Type      | Description      |
|-----------|-----------|------------------|
| href      | xs:string | href to work on. |

### 2.5.2 Function: xtlc:href-canonical() as xs:string

Makes an href canonical (remove any .. and . directory specifiers).

Examples:

- `href-canonical('a/b/./c') ==> 'a/c'`

| Parameter | Type      | Description      |
|-----------|-----------|------------------|
| href      | xs:string | href to work on. |

### 2.5.3 Function: `xtlc:href-concat()` as `xs:string`

Performs a safe concatenation of href components:

- Translates all backslashes into slashes
- Makes sure that all components are separated with a single slash
- If somewhere in the list is an absolute path, the concatenation stops.

Examples:

- `xtlc:href-concat(('a', 'b', 'c')) ==> 'a/b/c'`
- `xtlc:href-concat(('a', '/b', 'c')) ==> '/b/c'`

| Parameter            | Type       | Description  |
|----------------------|------------|--|
| href-path-components | xs:string* | The path components to concatenate into a full href. |

### 2.5.4 Function: `xtlc:href-decode-uri()` as `xs:string`

Reverse function of `encode-fo-uri()`. Translates percent encodings (`%xx`) into their actual characters.

| Parameter | Type      | Description      |
|-----------|-----------|------------------|
| href      | xs:string | href to work on. |

### 2.5.5 Function: `xtlc:href-ext()` as `xs:string`

Returns the extension part of an href.

Examples:

- `xtlc:href-ext('a/b/c.xml') ==> 'xml'`
- `xtlc:href-ext('a/b/c') ==> ''`

| Parameter | Type      | Description      |
|-----------|-----------|------------------|
| href      | xs:string | href to work on. |

### 2.5.6 Function: `xtlc:href-is-absolute()` as `xs:boolean`

Returns `true` if the href is considered absolute.

An href is considered absolute when it starts with a `/` or `\`, contains a protocol specifier (e.g. `file://`) or starts with a Windows drive letter (e.g. `C:`).

| Parameter | Type      | Description      |
|-----------|-----------|------------------|
| href      | xs:string | href to work on. |

### 2.5.7 Function: `xtlc:href-name()` as `xs:string`

Returns the (file)name part of an href.

Examples:

- `xtlc:href-name('a/b/c') ==> 'c'`
- `xtlc:href-name('c') ==> 'c'`

| Parameter | Type      | Description      |
|-----------|-----------|------------------|
| href      | xs:string | href to work on. |

### 2.5.8 Function: `xtlc:href-name-noext()` as `xs:string`

Returns the (file)name part of an href without its extension.

Examples:

- `xtlc:href-name-noext('a/b/c.xml') ==> 'c'`
- `xtlc:href-name-noext('a/b/c') ==> 'c'`

| Parameter | Type      | Description      |
|-----------|-----------|------------------|
| href      | xs:string | href to work on. |

### 2.5.9 Function: xtlc:href-noext() as xs:string

Returns the complete href path without its extension.

Examples:

- `xtlc:href-noext('a/b/c.xml') ==> 'a/b/c'`
- `xtlc:href-noext('a/b/c') ==> 'a/b/c'`

| Parameter | Type      | Description      |
|-----------|-----------|------------------|
| href      | xs:string | href to work on. |

### 2.5.10 Function: xtlc:href-path() as xs:string

Returns the path part of an href.

Examples:

- `xtlc:href-path('a/b/c') ==> 'a/b'`
- `xtlc:href-path('c') ==> ''`

| Parameter | Type      | Description      |
|-----------|-----------|------------------|
| href      | xs:string | href to work on. |

### 2.5.11 Function: xtlc:href-protocol() as xs:string

Returns the protocol part of an href (without the `://`).

Examples:

- `xtlc:href-protocol('http://...') ==> 'http'`

| Parameter | Type      | Description      |
|-----------|-----------|------------------|
| href      | xs:string | href to work on. |

### 2.5.12 Function: xtlc:href-protocol() as xs:string

Returns the protocol part of an href (without the `://`) or a default value when none present.

Examples:

- `xtlc:href-protocol('http://...', 'file') ==> 'http'`
- `xtlc:href-protocol('/a/b/c', 'file') ==> 'file'`

| Parameter        | Type      | Description  |
|------------------|-----------|--|
| href             | xs:string | href to work on.                                     |
| default-protocol | xs:string | Default protocol to return when \$ref contains none. |

### 2.5.13 Function: xtlc:href-protocol-add() as xs:string

Adds a protocol specifier (written without the trailing `://`, e.g. `http`) to an href.

| Parameter | Type       | Description  |
|-----------|------------|--|
| href      | xs:string  | href to work on.   |
| protocol  | xs:string  | The protocol to add, without a leading <code>://</code> part (e.g. just <code>file</code> or <code>http</code> ).                                |
| force     | xs:boolean | When <code>true</code> an existing protocol is removed first. When <code>false</code> , a reference with an existing protocol is left unchanged. |

### 2.5.14 Function: `xtlc:href-protocol-present()` as `xs:boolean`

Returns true when an href has a protocol specifier (e.g. `file://` or `http://`).

| Parameter | Type                   | Description      |
|-----------|------------------------|------------------|
| href      | <code>xs:string</code> | href to work on. |

### 2.5.15 Function: `xtlc:href-protocol-remove()` as `xs:string`

Removes the protocol part from an href.

Examples:

- `xtlc:protocol-remove('file:///a/b/c') ==> '/a/b/c'`

Weird exceptions:

- `xtlc:protocol-remove('file:/a/b/c') ==> '/a/b/c'`
- `xtlc:protocol-remove('file:/C:/a/b/c') ==> 'C:/a/b/c'`

| Parameter | Type                   | Description      |
|-----------|------------------------|------------------|
| href      | <code>xs:string</code> | href to work on. |

### 2.5.16 Function: `xtlc:href-relative()` as `xs:string`

Computes a relative href from one document to another.

Examples:

- `href-relative('a/b/c/from.xml', 'a/b/to.xml') ==> '../to.xml'`
- `href-relative('a/b/c/from.xml', 'a/b/d/to.xml') ==> '../d/to.xml'`

| Parameter | Type                   | Description                                 |
|-----------|------------------------|---|
| from-href | <code>xs:string</code> | href (of a document) of the starting point. |
| to-href   | <code>xs:string</code> | href (of a document) of the target.         |

### 2.5.17 Function: `xtlc:href-relative-from-path()` as `xs:string`

Computes a relative href from a directory path to a document.

Examples:

- `href-relative-from-path('a/b/c', 'a/b/to.xml') ==> '../to.xml'`
- `href-relative-from-path('a/b/c', 'a/b/d/to.xml') ==> '../d/to.xml'`

| Parameter      | Type                   | Description                                  |
|----------------|------------------------|--|
| from-href-path | <code>xs:string</code> | href (of a directory) of the starting point. |
| to-href        | <code>xs:string</code> | href (of a document) of the target.          |

### 2.5.18 Function: `xtlc:href-result-doc()` as `xs:string`

Transforms an href into something `xsl:result-document/@href` can use.

`xsl:result-document/@href` needs a `file://` in front and has some strict rules about the formatting. The input to this function *must* be an absolute href!

| Parameter | Type                   | Description                        |
|-----------|------------------------|------------------------------------|
| href      | <code>xs:string</code> | href to work on. Must be absolute! |

## 2.6 XSLT (2.0): `message.mod.xsl`

File: `xslmod/message.mod.xsl`

Message related templates.

A [message](#) is a standardized piece of XML used for inserting (error, debug, etc.) messages into XML documents.

| Prefix                          | Namespace URI                              |
|---------------------------------|--|
| xtlc                            | http://www.xtpplib.nl/ns/common            |
| Named template                  | Description                                |
| <a href="#">xtlc:msg-create</a> | Generates a standard xtlc:message element. |

### 2.6.1 Named template: xtlc:msg-create as element(xtlc:message)

Generates a standard xtlc:message element.

| Parameter        | Type         | Rq? | Default | Description   |
|------------------|--------------|-----|---------|---|
| extra-attributes | attribute()* |     | ()      | Any extra attributes to add to the message.   |
| extra-contents   | element()*   |     | ()      | Any extra elements to add to the message.   |
| msg-parts        | item()+      | yes |         | Message to show (parts will be concatenated by xtlc:items2str()).   |
| status           | xs:string    | yes |         | The status of the message. Must be one of the \$xtlc:status-* constants as defined in <a href="#">general.mod.xsl</a> . |

## 2.7 XSLT (2.0): mimetypes.mod.xsl

File: xslmod/mimetypes.mod.xsl

MIME type conversion related functions.

These conversions work with an [external MIME type/extension table](#).

| Prefix                              | Namespace URI  |
|-------------------------------------|--|
| xtlc                                | http://www.xtpplib.nl/ns/common  |
| Function                            | Description  |
| <a href="#">xtlc:ext2mimetype()</a> | Turns an href extension (e.g. xml') into the correct MIME type ('text/xml').     |
| <a href="#">xtlc:mimetype2ext()</a> | Turns a MIME type (e.g. 'text/xml') into a corresponding href extension ('xml'). |

### 2.7.1 Function: xtlc:ext2mimetype() as xs:string

Turns an href extension (e.g. xml') into the correct MIME type ('text/xml').

When it cannot find an appropriate MIME type it returns the empty string.

| Parameter | Type      | Description               |
|-----------|-----------|---------------------------|
| ext       | xs:string | The extension to convert. |

### 2.7.2 Function: xtlc:mimetype2ext() as xs:string

Turns a MIME type (e.g. 'text/xml') into a corresponding href extension ('xml').

When it doesn't recognize the MIME type it returns the empty string.

| Parameter | Type      | Description               |
|-----------|-----------|---------------------------|
| mimetype  | xs:string | The MIME type to convert. |

## 2.8 XSLT (3.0): parameters.mod.xsl

File: xslmod/parameters.mod.xsl

Takes an XML document with parameters and turns this into a parameter map.

More information [here](#).

| Prefix  | Namespace URI   |       |  |
|---|---|-------|--|
| xtlc  | http://www.xtpxlib.nl/ns/common   |       |  |
| Variable  | Type  | Value | Description  |
| xtlc:parameter-group-separator                        | xs:string   | '.'   | When a <group> element is encountered, this character is used as a separator after the group's name.                                       |
| xtlc:parameter-main-trigger-character                 | xs:string   | '\$'  | Use this variable for a quick check on whether something might contain a parameter: contains(..., \$xtlc:parameter-main-trigger-character) |
| Function  | Description   |       |  |
| <a href="#">xtlc:expand-text-against-parameters()</a> | Expands parameter references in \$text (either {\$...} or \${...}) against the parameters in \$parameter-map. If a parameter has multiple values, only the first one is used. |       |  |
| <a href="#">xtlc:parameters-get()</a>                 | Tries to locate a <parameters> element (in any namespace) underneath \$root-item and processes the child <parameter> and <group> elements in here into a parameter map.       |       |  |

### 2.8.1 Function: xtlc:expand-text-against-parameters() as xs:string

Expands parameter references in \$text (either {\$...} or \${...}) against the parameters in \$parameter-map. If a parameter has multiple values, only the first one is used.

| Parameter     | Type                       | Description                |
|---------------|----------------------------|----------------------------|
| text          | xs:string                  | Text to expand.            |
| parameter-map | map(xs:string, xs:string*) | Map with parameter values. |

### 2.8.2 Function: xtlc:parameters-get() as map(xs:string, xs:string\*)

Tries to locate a <parameters> element (in any namespace) underneath \$root-item and processes the child <parameter> and <group> elements in here into a parameter map.

The <value> elements are filtered according to the entries in \$filters.

Parameter references in values (either {\$...} or \${...}). are expanded. If a parameter has multiple values, only the first one is used.

| Parameter | Type                        | Description   |
|-----------|-----------------------------|---|
| root-item | item()                      | Root item under which the first <parameters> element is processed. Can be an href, a document node or an element. See <a href="#">xtlc:item2element()</a> on how this is processed. |
| filters   | map(xs:string, xs:string*)? | Any filters for the parameter's <value> elements.   |

## 2.9 XSLT (2.0): uuid.mod.xsl

File: xslmod/uuid.mod.xsl

UUID related functions.

Works only in Saxon PE or EE (not in the free HE), because we are calling an underlying Java function.

| Prefix                              | Namespace URI   |  |  |
|-------------------------------------|---|--|--|
| xtlc                                | http://www.xtpxlib.nl/ns/common   |  |  |
| Function                            | Description   |  |  |
| <a href="#">xtlc:get-uuid()</a>     | Returns a random unique UUID (by calling an underlying Java function)                   |  |  |
| <a href="#">xtlc:is-real-uuid()</a> | Checks whether a string contains a "real" UUID (conforms to the UUID formatting rules). |  |  |

### 2.9.1 Function: xtlc:get-uuid() as xs:string

Returns a random unique UUID (by calling an underlying Java function)

## 2.9.2 Function: `xtlc:is-real-uuid()` as `xs:boolean`

Checks whether a string contains a "real" UUID (conforms to the UUID formatting rules).

Example: 5EAE5C68-7394-48d7-A50B-1669E8D3A6C9 (upper/lower-case both admitted)

| Parameter       | Type                    | Description    |
|-----------------|-------------------------|----------------|
| <code>id</code> | <code>xs:string?</code> | UUID to check. |

## 3 XProc 1.0 Libraries

The xtpxlib-common component contains the following XProc (1.0) library module:

| Module/Pipeline             | Description                             |
|-----------------------------|---|
| <code>common.mod.xpl</code> | XProc (1.0) library with generic steps. |

Table 3-1 - Module overview

### 3.1 XProc (1.0) library: common.mod.xpl

File: `xplmod/common.mod/common.mod.xpl`

XProc (1.0) library with generic steps.

| Prefix            | Namespace URI                                |
|-------------------|--|
| <code>xtlc</code> | <code>http://www.xtpxlib.nl/ns/common</code> |

| Step                                       | Description  |
|--|--|
| <code>xtlc:copy-directory</code>           | Copies a full directory structure.   |
| <code>xtlc:copy-file</code>                | Copies a file, if necessary from inside a zip file.  |
| <code>xtlc:log</code>                      | Writes a message to a log file.  |
| <code>xtlc:recursive-directory-list</code> | Returns the contents of a directory, going into sub-directories recursively. When the requested directory does not exist, it returns only a <code>c:directory</code> root element with an <code>error="true"</code> attribute. |
| <code>xtlc:remove-dir</code>               | Removes a full directory. When the directory does not exist, everything continues without error.   |
| <code>xtlc:tee</code>                      | Tees the input to a file and passes it unchanged (like the Unix tee command).  |
| <code>xtlc:zip-directory</code>            | Zips a directory and its sub-directories into a single zip file.   |

#### 3.1.1 Step: `xtlc:copy-directory`

Copies a full directory structure.

| Port                | Type             | Primary? | Description                      |
|---------------------|------------------|----------|----------------------------------|
| <code>source</code> | <code>in</code>  | yes      | Input, will be passed unchanged. |
| <code>result</code> | <code>out</code> | yes      | The input unchanged.             |

| Option                       | Rq? | Default | Description  |
|------------------------------|-----|---------|--|
| <code>href-source-dir</code> | yes |         | Reference to the directory to copy from (must have a leading <code>file:/</code> specifier!).  |
| <code>href-target-dir</code> | yes |         | Reference to the directory to copy to (must have a leading <code>file:/</code> specifier!). If it does not exist the step will try to create it. |

#### 3.1.2 Step: `xtlc:copy-file`

Copies a file, if necessary from inside a zip file.

| Port                | Type             | Primary? | Description                      |
|---------------------|------------------|----------|----------------------------------|
| <code>source</code> | <code>in</code>  | yes      | Input, will be passed unchanged. |
| <code>result</code> | <code>out</code> | yes      | The input unchanged.             |

| Option                       | Rq? | Default              | Description   |
|------------------------------|-----|----------------------|---|
| <code>enable</code>          |     | <code>true ()</code> | Whether the copying is done at all.   |
| <code>href-source</code>     | yes |                      | Reference to the source file to copy (must have a leading <code>file:/</code> specifier!).  |
| <code>href-source-zip</code> |     | <code>' '</code>     | Document reference to a zip file (must have a leading <code>file:/</code> specifier!). When filled, <code>\$href-source</code> is assumed to be a path inside this zip. |
| <code>href-target</code>     | yes |                      | Reference to the target.  |

#### 3.1.3 Step: `xtlc:log`

Writes a message to a log file.

| Port   | Type | Primary? | Description  |
|--------|------|----------|--|
| source | in   | yes      | Input to the logging, will be passed unchanged to the output |
| result | out  | yes      | The input unchanged.   |

| Option        | Rq? | Default | Description  |
|---------------|-----|---------|--|
| enable        |     | true()  | Whether the logging will be done at all.   |
| href-log      | yes |         | Name of the file to write the log messages to (must have a leading file:/ specifier!).   |
| keep-messages |     | 100     | The number of messages to keep in the logfile. If le 0, all messages are kept. Set by default to 100 to prevent overflowing files... |
| message       | yes |         | The actual log message to write.   |
| status        |     | 'ok'    | Status of the message. Must be ok, warning, error or debug.  |

### 3.1.4 Step: xtlc:recursive-directory-list

Returns the contents of a directory, going into sub-directories recursively. When the requested directory does not exist, it returns only a `c:directory` root element with an `error="true"` attribute.

Adapted from Norman Walsh's [example code](#).

| Port   | Type | Primary? | Description  |
|--------|------|----------|--|
| result | out  | yes      | The resulting directory structure listing in XML format. |

| Option         | Rq? | Default | Description  |
|----------------|-----|---------|--|
| depth          |     | -1      | The sub-directory depth to go. When le 0, all sub-directories are processed.   |
| exclude-filter |     |         | An optional regular expression exclude filter.   |
| flatten        |     | false() | When true, the list will be "flattened": All <code>c:file</code> children will be direct children of the root's <code>c:directory</code> element. These <code>c:file</code> elements get a <code>@name</code> , <code>@href-abs</code> (absolute filename) and <code>@href-rel</code> (relative filename) attribute. |
| include-filter |     |         | An optional regular expression include filter.   |
| path           | yes |         | The path to get the directory listing from.  |

### 3.1.5 Step: xtlc:remove-dir

Removes a full directory When the directory does not exist, everything continues without error.

| Port   | Type | Primary? | Description                      |
|--------|------|----------|----------------------------------|
| source | in   | yes      | Input, will be passed unchanged. |
| result | out  | yes      | The input unchanged.             |

| Option   | Rq? | Default | Description   |
|----------|-----|---------|---|
| enable   |     | true()  | Whether the removal is done at all.   |
| href-dir | yes |         | Reference to the directory to remove (must have a leading file:/ specifier!). |

### 3.1.6 Step: xtlc:tee

Tees the input to a file and passes it unchanged (like the Unix tee command).

| Port   | Type | Primary? | Description  |
|--------|------|----------|--|
| source | in   | yes      | Input to the tee.  |
| result | out  | yes      | The input unchanged (unless a <code>\$root-attribute-href</code> was specified). |

| Option              | Rq? | Default | Description  |
|---------------------|-----|---------|--|
| enable              |     | true()  | Whether to actually do the write. When false, nothing happens.   |
| href                | yes |         | Name of the file to write to (must have a leading file:/ specifier!)   |
| indent              |     | true()  | Whether or not to indent the tee-d output.   |
| root-attribute-href |     | ' '     | If filled, <code>\$href</code> is recorded as an attribute with this name on the root element of the original input. Must be a valid attribute name. |

### 3.1.7 Step: xtlc:zip-directory

Zips a directory and its sub-directories into a single zip file.

| Port   | Type | Primary? | Description  |
|--------|------|----------|--|
| result | out  | yes      | The output of the actual zip step, listing all the files that went in. |

  

| Option          | Rq? | Default | Description   |
|-----------------|-----|---------|---|
| base-path       | yes |         | Directory which contents will be stored in the zip (must have a leading <code>file:/</code> specifier!)                                 |
| href-target-zip | yes |         | Document reference for the zip file to produce (must have a leading <code>file:/</code> specifier!)                                     |
| include-base    |     | true () | When true, the last part of <code>\$base-path</code> (e.g. <code>a/b/c ==&gt; c</code> ) is used as the root directory in the zip file. |

## 4 XProc 3.0 Support

### 4.1 oXygen XProc 3.0 support

The component contains a framework for oXygen that enables it to validate XProc 3.0 documents. To use this:

- Add the framework to the oXygen configuration:
  - Menu: Options / Preferences...
  - Navigate to: Document Type Association / Locations
  - Add the full path to `xtpplib-common/frameworks`
  - Navigate on up to: Document Type Association
  - Check that the XProc 3.0 framework is enabled
- Disable the use of the XProc 1.0 support in oXygen. To do this:
  - Menu: Options / Preferences...
  - Navigate to: File types
  - Associate the file types that you use for XProc 3.0 (in my case `.xpl` files) with the plain XML editor

| Module/Pipeline                           | Description  |
|---|--|
| <code>copy-dir.xpl</code>                 | This step copies a directory and all its contents from one location to the other.  |
| <code>create-clear-directory.xpl</code>   | This step does two things:   |
| <code>recursive-directory-list.xpl</code> | Extension of standard the <code>p:directory</code> list step. Returns the contents of a directory, going into sub-directories recursively. Adds the possibility to "flatten" the list. |
| <code>validate.xpl</code>                 | This step performs validation using a W3C Schema and/or Schematron. It breaks the processing if something is wrong.  |
| <code>write-log.xpl</code>                | Writes an entry to a log file.   |
| <code>zip-directory.xpl</code>            | Zips a directory into a single zip file.   |

Table 4-1 - Module overview

### 4.2 XProc (3.0) pipeline: copy-dir.xpl

File: `xpl3mod/copy-dir/copy-dir.xpl`

Type: `xtlc:copy-dir`

This step copies a directory and all its contents from one location to the other.

- If `$clear-target` is true (default), before copying the target directory is cleared/emtpied.
- If the source directory is empty, it simply creates an empty target directory.
- It can do include/exclude filtering, like `p:directory-list`

The step itself acts as an identity step.

| Port   | Type | Primary? | Description |
|--------|------|----------|-------------|
| source | in   | yes      |             |
| result | out  | yes      |             |

| Option                      | Type                    | Rq? | Default                | Description  |
|-----------------------------|-------------------------|-----|------------------------|--|
| <code>clear-target</code>   | <code>xs:boolean</code> |     | <code>true()</code>    | Whether to clear the target before copying.  |
| <code>depth</code>          | <code>xs:integer</code> |     | <code>-1</code>        | The sub-directory depth to go. When lt 0, all sub-directories are processed.   |
| <code>exclude-filter</code> | <code>xs:string*</code> |     | <code>'\..git/'</code> | Regular expression(s) for files to be excluded from the copy. By default, git directories are excluded                                     |
| <code>href-source</code>    | <code>xs:string</code>  | yes |                        | The full path/URI of the source directory. If the directory does not exist, nothing will happen.   |
| <code>href-target</code>    | <code>xs:string</code>  | yes |                        | The full path/URI of the target directory. Any non-existing parent directories leading up to this directory will be automatically created. |
| <code>include-filter</code> | <code>xs:string*</code> |     | <code>()</code>        | Regular expression(s) files to be included in the copy.  |

### 4.3 XProc (3.0) pipeline: create-clear-directory.xpl

File: xpl3mod/create-clear-directory/create-clear-directory.xpl

Type: xtlc:create-clear-directory

This step does two things:

- When \$clear is true, it removes an (optionally) existing directory
- Then it makes sure the directory always exists

It doesn't matter whether the directory exists beforehand.

The step itself acts as an identity step.

| Port   | Type | Primary? | Description |
|--------|------|----------|-------------|
| source | in   | yes      |             |
| result | out  | yes      |             |

| Option   | Type       | Rq? | Default | Description                                    |
|----------|------------|-----|---------|--|
| clear    | xs:boolean |     | true () | Whether or not to empty an existing directory. |
| href-dir | xs:string  | yes |         | The full path/URI of the directory to delete.  |

### 4.4 XProc (3.0) pipeline: recursive-directory-list.xpl

File: xpl3mod/recursive-directory-list/recursive-directory-list.xpl

Type: xtlc:recursive-directory-list

Extension of standard the p:directory list step. Returns the contents of a directory, going into sub-directories recursively. Adds the possibility to "flatten" the list.

This step will also *not* throw an error when the directory does not exist. Instead it will simply return an empty result (with an error="true attribute).

| Port   | Type | Primary? | Description  |
|--------|------|----------|--|
| result | out  | yes      | The resulting directory structure in XML format. See the standard p:directory-list step for a more detailed description. |

| Option         | Type       | Rq? | Default  | Description   |
|----------------|------------|-----|----------|---|
| add-decoded    | xs:boolean |     | false () | When true and \$flatten is true, attributes @href-rel-decoded and @href-abs-decoded are added in which any percent encoded characters are decoded.  |
| depth          | xs:integer |     | -1       | The sub-directory depth to go. When lt 0, all sub-directories are processed.  |
| detailed       | xs:boolean |     | false () | Whether to add detailed information.  |
| exclude-filter | xs:string* |     | '\.git/' | Optional regular expression exclude filters. By default, git directories are excluded.  |
| flatten        | xs:boolean |     | false () | When true, the list will be "flattened": All c:file children will be direct children of the root's c:directory element. These c:file elements get a @name, @href-abs (absolute filename) and @href-rel (relative filename) attribute. |
| include-filter | xs:string* |     |          | Optional regular expression include filters.  |

| Option                 | Type                         | Rq? | Default | Description   |
|------------------------|------------------------------|-----|---------|---|
| override-content-types | array (array (xs:string) ) ? |     | ()      | Override content types specification (see description of p:directory-list). |
| path                   | xs:string                    | yes |         | The path to get the directory listing from.                                 |

## 4.5 XProc (3.0) pipeline: validate.xpl

File: xpl3mod/validate/validate.xpl

Type: xtlc:validate

This step performs validation using a W3C Schema and/or Schematron. It breaks the processing if something is wrong.

This might seem superfluous (there are already p:validate-with... steps), but often these steps *change* the document. This step performs like a real identity step.

| Port   | Type | Primary? | Description                     |
|--------|------|----------|---------------------------------|
| source | in   | yes      | Document to validate.           |
| result | out  | yes      | The same as the input document. |

| Option          | Type       | Rq? | Default | Description   |
|-----------------|------------|-----|---------|---|
| href-schema     | xs:string? |     | ()      | Optional reference to an W3C Schema to validate the document with. If (), no schema validation will be performed.           |
| href-schematron | xs:string? |     | ()      | Optional reference to a Schematron Schema to validate the document with. If (), no Schematron validation will be performed. |
| schema-version  | xs:string  |     | '1.0'   | The W3C Schema version to use.  |

## 4.6 XProc (3.0) pipeline: write-log.xpl

File: xpl3mod/write-log/write-log.xpl

Type: xtlc:write-log

Writes an entry to a log file.

With regards to documents flowing through, acts like a p:identity step.

| Port   | Type | Primary? | Description  |
|--------|------|----------|--|
| source | in   | yes      | Documents will be passed unchanged to the result port. |
| result | out  | yes      | Documents coming from the source port, unchanged.      |

| Option                | Type                        | Rq? | Default | Description   |
|-----------------------|-----------------------------|-----|---------|---|
| additional-attributes | map (xs:QName, xs:string) ? |     | ()      | A map with additional attributes to add to the log entry's entry element.                           |
| additional-elements   | element() *                 |     | ()      | Elements with additional information to add to this log entry.                                      |
| enable                | xs:boolean                  |     | true()  | Whether the logging will be done at all.  |
| enable-debug-messages | xs:boolean                  |     | true()  | Whether messages with debug status will be written as well.   |
| href-log              | xs:string                   | yes |         | URI of the file to write the log entries to.  |
| keep-entries          | xs:integer                  |     | 0       | The number of entries to keep in the logfile. If ≤ 0, all messages are kept.                        |
| log-comments          | xs:string*                  |     | ()      | Any comments to write as file header when creating a new log file. Ignored on an existing log file. |

| Option   | Type       | Rq? | Default | Description   |
|----------|------------|-----|---------|---|
| messages | xs:string+ | yes |         | The actual texts/lines of the log entry to write. All will become a separate message element. |
| status   | xs:string  |     | 'info'  | Status of the entry. Must be info, warning, error or debug.                                   |

## 4.7 XProc (3.0) pipeline: zip-directory.xpl

File: xpl3mod/zip-directory/zip-directory.xpl

Type: xtlc:zip-directory

Zips a directory into a single zip file.

| Port   | Type | Primary? | Description                                   |
|--------|------|----------|---|
| result | out  | yes      | The archive manifest of the created zip file. |

| Option          | Type       | Rq? | Default   | Description   |
|-----------------|------------|-----|-----------|---|
| base-path       | xs:string  | yes |           | URI of the directory which contents will be stored in the zip.  |
| depth           | xs:integer |     | -1        | The sub-directory depth to go. When lt 0, all sub-directories are processed.  |
| exclude-filter  | xs:string* |     | '\ .git/' | Optional regular expression exclude filters. By default, git directories are excluded.                                    |
| href-target-zip | xs:string  | yes |           | URI for the zip file to produce.  |
| include-base    | xs:boolean |     | true()    | When true, the last part of \$base-path (for instance a/b/c ==> c) is used as root directory for entries in the zip file. |
| include-filter  | xs:string* |     |           | Optional regular expression include filters.  |

## 5 XSLT Stylesheets

The xtpplib-common component contains the following XSLT Stylesheets:

| Module/Pipeline                           | Description   |
|---|---|
| <a href="#">get-system-properties.xml</a> | Gets all the XSLT available system properties (as returned by <code>system-property()</code> ).   |
| <a href="#">xslmod2xqmod-stub.xml</a>     | This stylesheet translates an XSLT module (in xtpplib "style") into a stub for an XQuery Module. After this you still need to hand-edit it to make it all work. |

Table 5-1 - Module overview

### 5.1 XSLT (2.0): get-system-properties.xml

File: `xsl/get-system-properties.xml`

Gets all the XSLT available system properties (as returned by `system-property()`).

### 5.2 XSLT (2.0): xslmod2xqmod-stub.xml

File: `xsl/xslmod2xqmod-stub.xml`

This stylesheet translates an XSLT module (in xtpplib "style") into a stub for an XQuery Module. After this you still need to hand-edit it to make it all work.

See as an example [href.mod.xml](#). Large parts of this module were turned into XQuery by this stylesheet. The result (edited after this initial conversion) is in the `xqmod` directory of this component.

## 6 XML Data Files

The xtpplib-common component contains the following XML data files:

| Module/Pipeline                        | Description   |
|--|---|
| <a href="#">dummy.xml</a>              | Dummy file to use as input for processes that require an XML input document but the input is ignored. |
| <a href="#">fop-default-config.xml</a> | Default configuration file for the FOP XSL-FO renderer.   |
| <a href="#">mimetypes-table.xml</a>    | Table used for transforming file extensions into a MIME type and vice versa.                          |

Table 6-1 - Module overview

### 6.1 XML document: dummy.xml

File: data/dummy.xml

Root element: <dummy>

Dummy file to use as input for processes that require an XML input document but the input is ignored.

### 6.2 XML document: fop-default-config.xml

File: data/fop-default-config.xml

Root element: <fop>

Default configuration file for the FOP XSL-FO renderer.

The only thing this configuration file does is set the font handling to "auto-detect" (meaning it will try the use the system fonts).

### 6.3 XML document: mimetypes-table.xml

File: data/mimetypes-table.xml

Root element: <mimetypes> (namespace: <http://www.xtpplib.nl/ns/mimetypes>)

Table used for transforming file extensions into a MIME type and vice versa.

Follows the [mimetypes.xsd](#) schema. Used internally by the [mimetypes.mod.xsl](#) module, but might also be useful in other situations.

## 7 XML Schemas

The xtpxlib-common component contains the following XML Schemas:

| Module/Pipeline                | Description   |
|--------------------------------|---|
| <a href="#">message.xsd</a>    | Schema for messages used and created by this component. |
| <a href="#">mimetypes.xsd</a>  | Schema for the MIME type association datafile.          |
| <a href="#">parameters.xsd</a> | Schema for sets of parameters as used by this library.  |

Table 7-1 - Module overview

### 7.1 XML Schema: message.xsd

File: `xsd/message.xsd`

Target namespace: `http://www.xtpxlib.nl/ns/common`

Schema for messages used and created by this component.

See also [message.mod.xsl](#).

| Element | Description                            |
|---------|--|
| message | A message generated by this component. |

### 7.2 XML Schema: mimetypes.xsd

File: `xsd/mimetypes.xsd`

Target namespace: `http://www.xtpxlib.nl/ns/mimetypes`

Schema for the MIME type association datafile.

See also [mimetypes-table.xml](#) and [mimetypes.mod.xsl](#).

| Element   | Description                                     |
|-----------|---|
| mimetypes | Root element of the MIME types associaton list. |

### 7.3 XML Schema: parameters.xsd

File: `xsd/parameters.xsd`

Schema for sets of parameters as used by this library.

Use [parameters.mod.xsl](#) for turning these lists into maps. An explanation of the parameter mechanism can be found [here](#).

Although this is schema for no namespace, parameters can be in *any* namespace (if you use [parameters.mod.xsl](#) for processing them).

| Element    | Description   |
|------------|---|
| parameters | Root element for a set of parameters (either in a document on its own or embedded). |
